

# Zymox

After Claro treatment there's **four** realizations:

1. Your dog is not like other dogs, for whatever reason, they're (genetically/breed?) prone to ear infections.
2. Your dog may have a lifestyle that contributes to ear infections, for example: Swimming. Tiny ear holes. Too much hair.
3. For a LOT of dogs, ear infections come from #ATOPY and that's chronic
  - a. [Johnsonvet.com/atopy](http://Johnsonvet.com/atopy)
4. Your dog's ear "environment" has just been cannon-balled by strong medication to achieve 'wellness' and needs help restoring a proper pH and bacterial balance.

**Zymox** is scarcely more than an (ear-appropriate) oil-base which lifts excess wax off the walls of the ear canals and restores the proper pH and bacterial colonies which actually belong in the ear.

- It's squalene, and that's water repellent making it awesome for swimmers.
- Squalene makes the ear canal too slickery to hold onto dark wax.
- It has enzymes which digest organics, break down wax, and inhibit/outcompete yeast organisms and untoward germs.
- It has compounds to down-regulate the acidity in the ear.

All you do is just apply a little (like oiling a clock or oil on a whetstone, just a bit) Zymox to both ears on days of the week containing a "T" for example Tuesday, Thursday and Saturday. Or of course, any three days a week you can remember.

You don't have to wipe, rub or anything. Just a few drops to create a slight glisten, and you're good.

Questions?
